

# Worm Maths

- 1000 compost worms weigh around 250 grams.
- Worms eat around half their body weight in food a day.
- Worms double their population every three months.

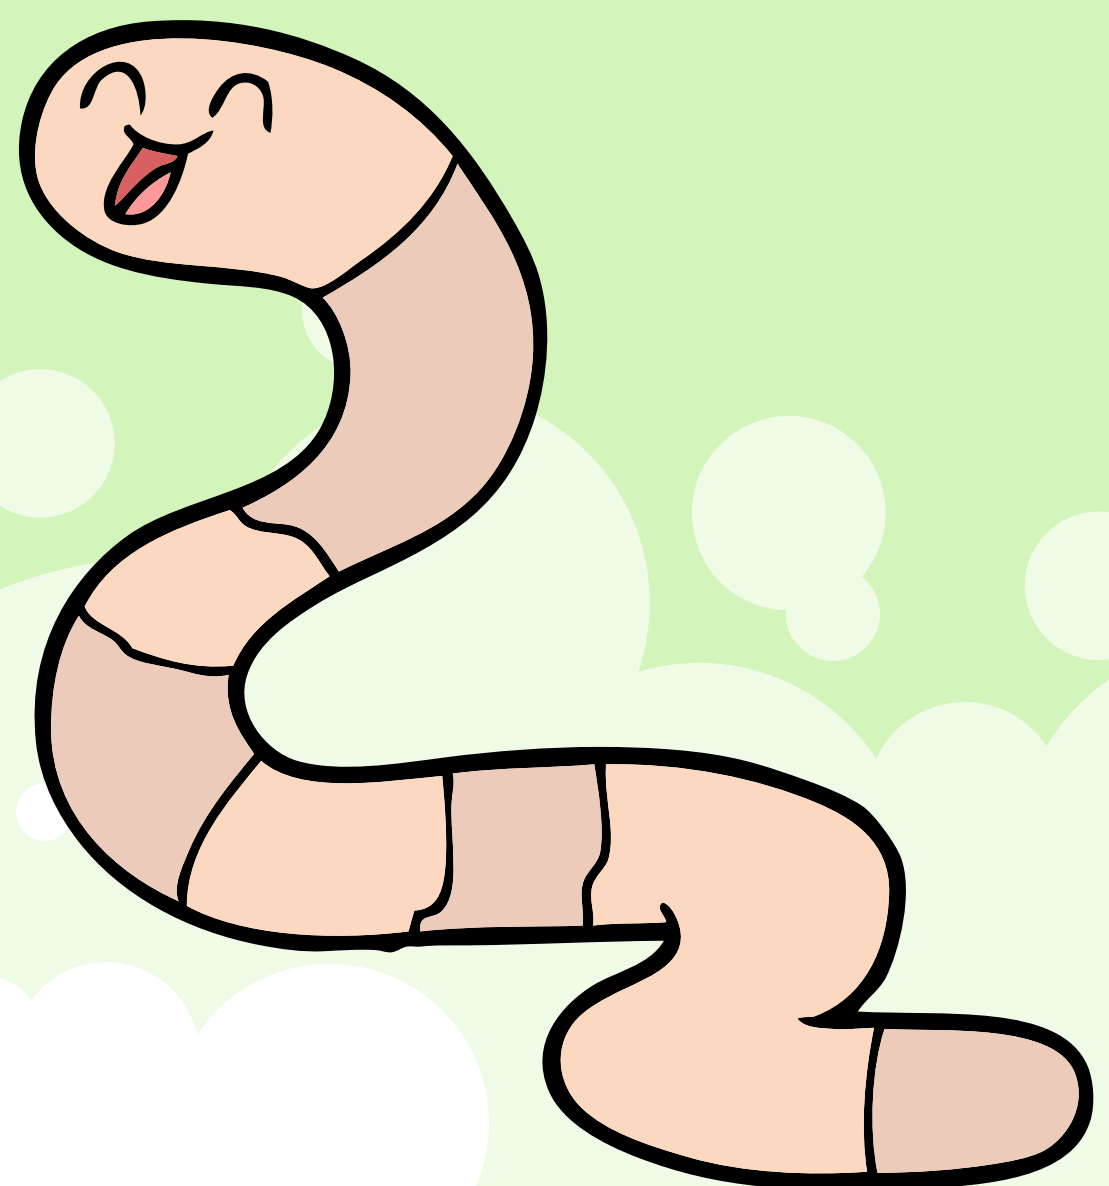

Using that knowledge, calculate the following:

How many grams of food will 1000 worms eat in a day?

How many months until you have 10,000 worms?

Approximately what does 100 worms weigh?

How many worms would you need to compost 1kg of food per day?
